

Hamming-distance RadViz projection onto 6 archetype anchors (softmax T=10)
 Simulated RORA_RORB knockdown vs. ASCL1 knockout (positive control) vs. unperturbed walk trajectories (organoid 'Neuroendocrine1' start)

Full projection (true scale)
 dashed box = region magnified at right

Zoomed inset -- same data, magnified
 (individual walks only legible at this scale)

Note: every labeled point (6 hexagon vertices + the 2 circles) is one of bobaT's 8 fitted archetype average states, projected by Hamming distance to the 6 vertex archetypes (softmax, T=10) -- not the continuous archetype-signature scores used in the original reference figure. ASCL1 is a canonical NE master regulator, so its knockout is a positive control expected to drive an unambiguous, strong NE -> nonNE shift -- included as a reference point for how large a clearly-real effect looks here, alongside RORB's more subtle, hypothesis-specific one.
