

Hamming-distance RadViz projection onto 6 archetype anchors
organoid_shGFP real cells (background) + simulated RORA_RORB knockdown walk trajectory (overlay)
Full projection (true scale)
dashed box = region magnified at right

Zoomed inset -- same data, magnified
(paths/cells only legible at this scale)

— organoid 'Neuroendocrine1' start, RORA_RORB knockdown (light->dark = early->late) ● path start
— organoid 'Neuroendocrine1' start, unperturbed (light->dark = early->late) ■ path end (step 4000)

Note: this projection uses Hamming distance to each archetype's discrete Boolean average state (softmax, T=10), not the continuous archetype-signature scores used in the original reference figure. Confirmed divergence: Generalist_NE's own state projects toward the NE1/NE2 edge here (Hamming-close to both), not to the center as in the reference figure -- shown honestly via the grey star in both panels.
