

External-validation Mean  $R^2$  across all scored samples, by sample type  
 GEMM run 6667's fitted rules, scored against each sample's own held-out data  
 (all 53 network genes (11 self-loop))

Each dot = one sample's own metric (organoid\_combined excluded -- it's an aggregate of the 3 organoid rows below, not an independent sample). organoid\_shGFP and mets\_compiled are labeled directly since they're the focus of this investigation. Grey diamond/bar = scrambled-data null, mean  $\pm$  95% CI (12-12 iters/category, 1-3 samples/category) -- most real samples score above it.
