

External-validation Mean R^2 across all scored samples, by sample type
 GEMM run 6667's fitted rules, scored against each sample's own held-out data
 (42 non-self-loop network genes)

Each dot = one sample's own metric (organoid_combined excluded -- it's an aggregate of the 3 organoid rows below, not an independent sample). organoid_shGFP and mets_compiled are labeled directly since they're the focus of this investigation. Grey diamond/bar = scrambled-data null, mean $\pm$ 95% CI (2-2 iters/category, 1-1 samples/category) -- most real samples score above it.
