

Hamming-distance RadViz projection onto 6 archetype anchors

Simulated RORA_RORB knockdown vs. unperturbed walk trajectories (organoid 'Neuroendocrine1' start)

Full projection (true scale)

dashed box = region magnified at right

Zoomed inset -- same data, magnified (individual walks only legible at this scale)

— RORA_RORB knockdown: mean path (light->dark = early->late)

— Unperturbed: mean path (light->dark = early->late)

— RORA_RORB knockdown: 100 individual walks

— Unperturbed: 100 individual walks

● path start

■ path end (step 4000)

● Generalist_NE (archetype average state, not a hexagon vertex)

● Intermediate/Arc_1 (archetype average state, not a hexagon vertex)

distance to the 6 vertex archetypes (softmax, T=10) -- not the continuous archetype-signature scores used in the original reference figure.

Confirmed divergence: Generalist_NE's own state projects toward the NE1/NE2 edge here (Hamming-close to both), not to the center as in the reference figure -- shown honestly via its own circle marker rather than forced to the center.
