

Hamming-distance RadViz projection onto 6 archetype anchors (softmax T=10)
RORA_RORB knockdown vs. unperturbed walk trajectories (GEMM NE1 (true attractor state) start)

Full projection (true scale)
dashed box = region magnified at right

Zoomed inset -- same data, magnified

- | | |
|--|--|
| — RORA_RORB knockdown: mean path (light->dark = early->late) | ● path start |
| — Unperturbed: mean path (light->dark = early->late) | ■ path end (step 4000) |
| — RORA_RORB knockdown: 100 individual walks | ● Generalist_NE (archetype average state) |
| — Unperturbed: 100 individual walks | ● Intermediate/Arc_1 (archetype average state) |

Note: start is one of bobaT's own dynamically-discovered attractor states (0/53 genes with >50% flip probability -- a genuine fixed point, confirmed directly), NOT the archetype's average state (compare to the companion plots without this suffix). Hexagon vertices + the 2 circles are GEMM's own fitted archetype average states, projected by Hamming distance to the 6 vertex archetypes (softmax, T=10); colors matched to the user's reference figure (ref_hex).
