

Hamming-distance RadViz projection onto 6 archetype anchors (softmax T=10)
RORA_RORB overexpression vs. unperturbed walk trajectories (GEMM Generalist_nonNE (archetype average state) start)

Full projection (true scale)
dashed box = region magnified at right

Zoomed inset -- same data, magnified

Note: start is the archetype's own AVERAGE state (average_states.txt; confirmed matched exactly by real cells) -- NOT one of bobaT's own dynamically-discovered attractor states. A genuine attractor has 0/53 genes with >50% flip probability under the fitted rules; this average state does not (see FINDINGS.md and the companion *_true_attractor plots, which start from an actual discovered attractor instead).
