

Hamming-distance RadViz projection: GEMM real cells (by own phenotype label) (by S_0.5threshold_splitgen, 50% HDR contours) vs. GEMM's fixed archetype anchors

Full projection (true scale)
dashed box = region magnified at right

Zoomed inset -- same data, magnified

Note: each contour is the smallest region containing 50% of that group's estimated probability mass (2D Gaussian KDE over the group's Hamming-distance projection), evaluated on a shared grid so contours are directly comparable across groups. Groups with <20 cells are shown as raw points instead. Hexagon vertices + the 2 circles are GEMM's own fitted archetype average states (see plot_radviz_archetype_projection.py for the full projection method).
